

CHARACTERISTICS:

The central conductor is a magnetization spindle allowing (depending on the version):

- the passage of the field through a large number of joined steel wires and/or
- the passage of the current through a copper bar embedded in the centre of the conductor

and/or

- spraying by means of a double envelope in which the magnetic particle inspection indicator product circulates

The exterior of the conductor is made in glass fabric so as to obtain a very tough insulating coating.

There is a complete standard range of central conductors, with diameters from 16 mm to 80 mm.

(Contact our Sales department for all information relating to the available dimensions. Special dimensions on request).
